

CLEANING

General remarks

All our congratulations for your laminated floor covering: you made the good decision - for a floor covering easy to maintain, solid and resistant in time with a hygienic surface.

You can easily and quickly to contribute yourself so that the esthetic and the value of your new laminated flooring are a long time preserved: take care of the temperature of the part (20 - 22 °C) and of a relative humidity of 50 to 60%.

Like this you will maintain your laminated flooring under the best possible conditions for in the presence of a water content of the too high air, the panels derived from the wood of the laminated elements - as all materials containing wood - tend to dilate. On the contrary, a low rate of humidity (in the presence of air-conditioning or heat flooring) associated a high temperature carries out to the shrinkage. For the period of heating, it is advised to use humidifiers.

It is to better avoid dirtiness to have to remove it

All that is known: the greatest part of dirtiness is brought back outside and is dispersed in the house. Best cleaning consists in avoiding dirtiness - by simply leaving it in front of the door. . . How to make?

Quite simply, it is enough to put a rather large doormat in front of your door of entry. It is even preferable to get two of them so that one can alternate their cleaning.

And do not forget: dirtiness attacks all the floor coverings: the stones, aso, have an effect of abrasive paper and leave unpleasant traces!

Your laminated flooring will remain esthetic even longer by putting felt tips under the feet of the chairs, the tables and the pieces of furniture - in order to move them easily and to avoid the possible stripes.

Still a council: do not forget to equip the chairs with office, the sorters and mobile containers of casters with flexible bindings - one recognizes them with their two-tone construction. Even if the equipment already exists, the old hard casters and/or at the sharp edges must be changed.

The first basic cleaning

Before the use, to initially remove the sawdust, dust and dirtiness with a brush or a vacuum cleaner. For the first cleaning, clear water is not always sufficient, it is then enough to add with water a little product of cleaning specific to the laminated flooring, advised by the manufacturer. The rag must be just humidified, well dried not to drip more of the whole. If it remains after the installation of the tough traces of adhesive on the surface it is then advised to use one cleaning special for laminated surfaces which is to be proportioned

according to recommendations' of the manufacturer to prevent that the joints of adhesive are not faded.

Cleaning running at home

All the floor coverings are subjected to a natural wear which depends on the quality of the type of use and floor covering - thanks to a regular cleaning you contribute to the maintenance of the value of your flooring.

Your new laminated flooring has a hard and impermeable surface, on which dirtiness does not have a catch, which makes it possible to withdraw it easily.

A vacuum cleaner adapted on the hard ground or a dry cleaning with a any other similar process or mop is well adapted to remove nonadherent dirtiness on the ground.

A useful recommendation: one knows by experiment that the large one of dirtiness can be eliminated thanks to an especially impregnated rag to trap dust or by a rag in charge of static electricity. But, the daily use of an impregnated dustcloth can carry out to a sticking and thus to a reinforced adherence of dust.

A first treatment with products of cleaning or maintenance forming a protective film is not necessary. One should not in no case to use wax or polish! Those do not adhere to the impermeable laminated flooring, they do not penetrate and leave unpleasant tasks, trails and traces of step.

Tough dirtinesses

The tasks due with use, the traces of soles, the features of colouring pencil and other dirtinesses can be eliminated while following the rules from the following table:

- Rubber friction, traces of soles, dirtiness of outside, colouring pencils, fatty pastel

Council: to brush dry mechanically with for example, a synthetic plug not striping

- Fruits, bays, milk, beer, wine, tea, lemonade

Council: to wipe immediately with an absorbing rag or if the task already dry with one cleaning is adapted to surfaces laminated then to finish with a dry rag

- Blood

Council: immediately clean with a wet rag, if the task is dry to brush dry with a synthetic plug not striping, clean what adheres with one cleaning adapted to laminated surfaces, then to finish with a dry rag

- Nail polish, waxing, varnished, oil, tar, grease, marker pen, ink, Indian ink, lipstick, carbon paper, ribbon of typewriter Removed if possible with...

Council: clean with a moistened solvent rag for example: acetone, gasoline or vinegar, solvent, or unspecified thinner, in all the cases use with precaution and moderation only at the tried place. respect the security instructions!

- Chocolate, grease stains, salad oil

Council: with one cleaning adapted to the laminated flooring
